

\$AGIALPHA Autopilot

Automate \$AGIALPHA as the proof-settlement fuel of GoalOS - safely, evidence-first, and human-gated where value is at risk.

Goal -> budget -> bounded job -> proof -> validation -> settlement-readiness -> Chronicle.

Not token hype. A utility coordination layer for verified machine labor.

Simulation first, Sepolia rehearsal second, Mainnet human-gated later.

The one rule

Use \$AGIALPHA only where proof changes state.

No ProofBundle -> no settlement.

No eval -> no propagation.

No rollback -> no release.

No Evidence Docket -> no strong claim.

No human gate -> no Mainnet value movement.

The operating loop

Request

Bounded mission + success metric

Escrow

AGIALPHA budget + reviewer reserve

Execute

Agents/builders act off-chain

Proof

ProofBundle + Evidence Docket

Validate

Reviewer attestation + challenge

Settle

Readiness gate + reputation

Autopilot modules

Goal to proof mission

Budgeter

Risk-tier AGIALPHA quote

ProofBuilder

ProofBundle + docket

ValidatorDesk

Reviewer packet

AlphaWUMeter

Verified work score

TreasuryRouter

Reinvest future capacity

Automation levels

- L0 Simulation: no token movement; best starting point.
- L1 Local: local rehearsal with mock/test balances.
- L2 Sepolia: testnet proof-settlement rehearsal.
- L3 Mainnet read-only: quotes and packets only.
- L4 Mainnet human-gated: capped pilots after audit/review.
- L5/L6: future only after evidence, audits, and robust disputes.

First three missions

Proof Card 010-A: Cyber-Sovereign Evidence Docket.

Proof Card 012-A: AI-Startup Venture Grid / revenue-proof docket.

Personal Money Sprint: consumer proof dockets for regular people.

Together: technical proof + commercial proof + consumer proof.

GitHub Actions boundary

Actions may prepare, verify, package, and publish evidence.

Actions may run simulation and Sepolia rehearsal with protected environment approval.

Actions must not broadcast Ethereum Mainnet transactions.

Mainnet value movement remains local, human-gated, and evidence-dependent.

The evidence graph moat

Every mission produces dockets, reviewer packets, alpha-WU scores, settlement records, and Chronicle entries.

The cumulative asset is the evidence graph of what worked, who proved it, and what should fund the next mission.

A webpage can be copied. A long-running evidence graph cannot be retroactively fabricated.

30-day execution plan

Week 1: install code kit and run 010-A simulation.

Week 2: run 012-A and Personal Money Sprint simulations.

Week 3: recruit reviewers and run external review packets.

Week 4: run Sepolia rehearsal and publish public-safe evidence index.

Closing

The best AGIALPHA automation is boring, explicit, hard to misuse, and easy to audit.

Make \$AGIALPHA the utility bloodstream of verified machine labor.

Let proof, not token motion, decide what evolves.

Start with simulation. Earn Sepolia. Gate Mainnet. Compound evidence.
