

Codex Implementation Prompt v2

Copy-paste prompt for implementing AGIALPHA Autopilot in the GitHub repository

Use this prompt to ask Codex to create a PR, not to deploy or move value.

You are Codex acting as a top-tier Ethereum, Solidity, Hardhat, TypeScript, Python, GitHub Actions, security, and developer-experience engineering firm.

Repository:

<https://github.com/MontrealAI/goalos-agialpha-ascension>

Mission:

Implement AGIALPHA Autopilot: a safe, evidence-first automation layer that uses \$AGIALPHA as the proof-settlement fuel of GoalOS-native alpha-AGI Ascension.

Core loop:

Goal -> AGIALPHA budget -> bounded job -> proof -> validator review -> alpha-Work Unit score -> settlement-readiness -> reputation update -> Chronicle -> treasury reinvestment -> stronger future work.

Doctrine:

Aim -> Act -> Prove -> Evolve.

Request -> Escrow -> Execute -> Proof -> Validate -> Settle -> Chronicle.

Non-negotiable boundaries:

- Do not put intelligence on-chain. Put proof of intelligence on-chain.
- No proof, no evolution.
- No eval, no propagation.
- No rollback, no release.
- \$AGIALPHA is utility for stake, escrow, settlement, coordination, validator incentives, slashing, and treasury routing.
- \$AGIALPHA is not equity, dividends, profit share, yield, investment return, ownership, or a token price claim.
- Do not broadcast Ethereum Mainnet transactions from GitHub Actions.
- Do not add any workflow that can move Mainnet value.
- Do not log or commit private keys, RPC URLs, API keys, mnemonics, seeds, signatures, or secrets.
- Do not claim achieved AGI, ASI, superintelligence, guaranteed ROI, legal approval, tax approval, external audit completion, production safety, or Ethereum Mainnet deployment unless evidence exists.

First inspect before editing:

1. package.json
2. hardhat.config.ts
3. scripts/config/networkConfig.ts
4. contracts/registry and contracts/aep
5. scripts/deployment and deploy-core scripts
6. docs/ and qa/ evidence files
7. .github/workflows
8. README and public status docs

Implementation approach:

Do not rewrite contracts unless absolutely necessary. Build a safe automation layer around the existing contracts, scripts, evidence folders, and proof-card architecture.

Deliverables:

1. Create AGENTS.md.

Tell future Codex runs that this is a claim-bounded evidence-first repo. No fabricated deployment evidence. No CI Mainnet broadcast. No weakening gates. No secrets. No token-price or ROI claims. Any PR touching settlement or deployment must include tests and claim-boundary impact.

2. Create config/agialpha-autopilot.policy.json.

Include:

- canonical mainnet AGIALPHA token: 0xA61a3B3a130a9c20768EEBF97E21515A6046a1fA
- modes: simulation, local, sepolia, mainnet_readonly, mainnet_human_gated
- risk tiers with caps, reviewers, challenge windows, human gates
- settlement splits
- proof requirements
- treasury routing rules
- forbidden claims
- no-mainnet-from-CI invariant

3. Create schemas:

- schemas/agialpha-mission.schema.json
- schemas/agialpha-budget-quote.schema.json
- schemas/agialpha-settlement-readiness.schema.json
- schemas/agialpha-treasury-routing.schema.json
- schemas/agialpha-evidence-docket.schema.json

4. Create scripts/agialpha-autopilot/.

Implement a CLI that can run in simulation, sepolia, and mainnet-readonly mode.

Required commands or subcommands:

- intake
- quote
- funding
- proof
- docket
- reviewer-packet
- alpha-wu
- settlement-ready
- treasury-route
- evidence-index
- run-all

The run-all command must generate:

- budget-quote.json
- funding-instructions.md
- proofbundle.json
- evidence-docket.md
- reviewer-packet.md
- alpha-wu-score.json
- settlement-readiness.json

- treasury-routing.json
- chronicle-entry.md
- index.html

5. Add npm scripts:

- agialpha:autopilot:simulation
- agialpha:autopilot:sepolia
- agialpha:autopilot:mainnet-readonly
- agialpha:mission:intake
- agialpha:quote
- agialpha:proof
- agialpha:docket
- agialpha:settlement-ready
- agialpha:treasury-route
- agialpha:evidence-index

6. Add workflows:

- .github/workflows/agialpha-autopilot-simulation.yml
- .github/workflows/agialpha-sepolia-proof-settlement-rehearsal.yml
- .github/workflows/agialpha-mainnet-readonly-operator-packet.yml

Workflow rules:

- Simulation may run on PR or workflow_dispatch.
- Sepolia must be workflow_dispatch and protected by a sepolia environment.
- Mainnet workflow is read-only only. It must not contain private keys, ALLOW_MAINNET_DEPLOYMENT, or broadcast commands.
- Use least-privilege permissions: contents: read by default. Elevate only where a job opens a PR or uploads artifacts.
- Upload artifacts and open PRs for generated evidence. Do not auto-merge.

7. Create example missions:

- examples/agialpha-missions/proof-card-010a-cyber-evidence-docket.json
- examples/agialpha-missions/proof-card-012a-venture-grid.json
- examples/agialpha-missions/personal-money-sprint.json

8. Create docs:

- docs/AGIALPHA_AUTOPILOT_START_HERE.md
- docs/AGIALPHA_AUTOPILOT_OPERATOR_GUIDE.md
- docs/AGIALPHA_AUTOPILOT_CLAIM_BOUNDARY.md
- docs/AGIALPHA_AUTOPILOT_SEPOLIA_REHEARSAL.md
- docs/AGIALPHA_AUTOPILOT_MAINNET_READONLY.md
- docs/AGIALPHA_AUTOPILOT_TROUBLESHOOTING.md

Docs must be nontechnical, command-first, and include what is safe to share, what must stay private, and what the generated files mean.

9. Add tests.

Cover:

- mission schema validation
- policy loading
- budget quote math
- risk tier caps
- settlement split sums to 1
- no settlement-ready without ProofBundle
- no settlement-ready without evaluator pass

- no propagation without rollback plan
- no mainnet broadcast from CI
- canonical AGIALPHA token enforcement
- MockAGIALPHA forbidden on mainnet
- unsafe claim detection
- secret redaction
- generated evidence validates against schema
- claim boundary appears in all generated reports

10. Produce a PR.

Title:

Add AGIALPHA Autopilot for proof-settled mission budgeting, evidence, and human-gated settlement

PR body must include:

- summary
- files added
- nontechnical operator path
- safety boundaries preserved
- commands to run
- tests run
- tests failed, if any
- claim-boundary impact
- follow-up recommendations

Definition of done:

- A nontechnical operator can run one example mission in simulation mode.
- The system produces budget quote, funding instructions, ProofBundle, Evidence Docket, reviewer packet, alpha-WU score, settlement-readiness report, treasury routing, Chronicle entry, and evidence index.
- No workflow can broadcast Ethereum Mainnet transactions.
- All generated outputs include claim boundaries.
- Tests cover safety-critical gates.

Final instruction:

Prioritize safety, clarity, reproducibility, and operator confidence over cleverness. The best AGIALPHA automation is boring, explicit, difficult to misuse, and easy to audit.
