

AI creates output. GoalOS creates proof. The deliverable is not a document; it is a governed decision state.

Publication law

Website publication is governed work:
Content source → Generator → QA → PR → Human review → Live site → Chronicle.

Mission loop

Objective → Mission Contract → Autonomous Work → Verification → Evidence Docket → Decision State → Action Graph → Chronicle.

Canonical doctrine

A model can answer. An agent can act. An institution must prove.
No proof, no settlement. No eval, no propagation. No rollback, no release.

Mission value

$$\text{MissionValue} = \frac{DI \cdot PI \cdot A \cdot R}{C + Risk + L + PD}$$

<i>DI</i>	Decision impact
<i>PI</i>	Proof integrity
<i>A</i>	Actionability
<i>R</i>	Reuse
<i>PD</i>	Proof debt

Proof-to-action law

$$AIWork = Output \cdot Proof \cdot Validation \cdot Actionability \cdot Reuse$$

If *Proof* = 0, trusted institutional work is zero.

Publish readiness

$$PublishReady = C_v \wedge B_p \wedge Q_p \wedge C_b \wedge H_r$$

Content valid, build pass, QA pass, claim boundary pass, human review.

Governed decision state

Mission Contract; Claims Matrix; Source Provenance; Contradiction Register; Evidence Docket; Verifier Report; Risk Ledger; Executive Brief; Action Graph; Chronicle; Capability Package.

AGIALPHA boundary

AGIALPHA is proof-settlement fuel: budget, escrow, stake, validation, settlement, reputation, and treasury routing. It is not equity, yield, profit share, ownership, or guaranteed return.

Claim boundary

No achieved AGI/ASI claim. No guaranteed ROI claim. No production-security or external-audit claim without evidence. No Mainnet deployment claim without chain evidence.

The website is generated from proof-aligned source, checked by automation, reviewed by a human, and then published.
